Tomasulo's Algorithm

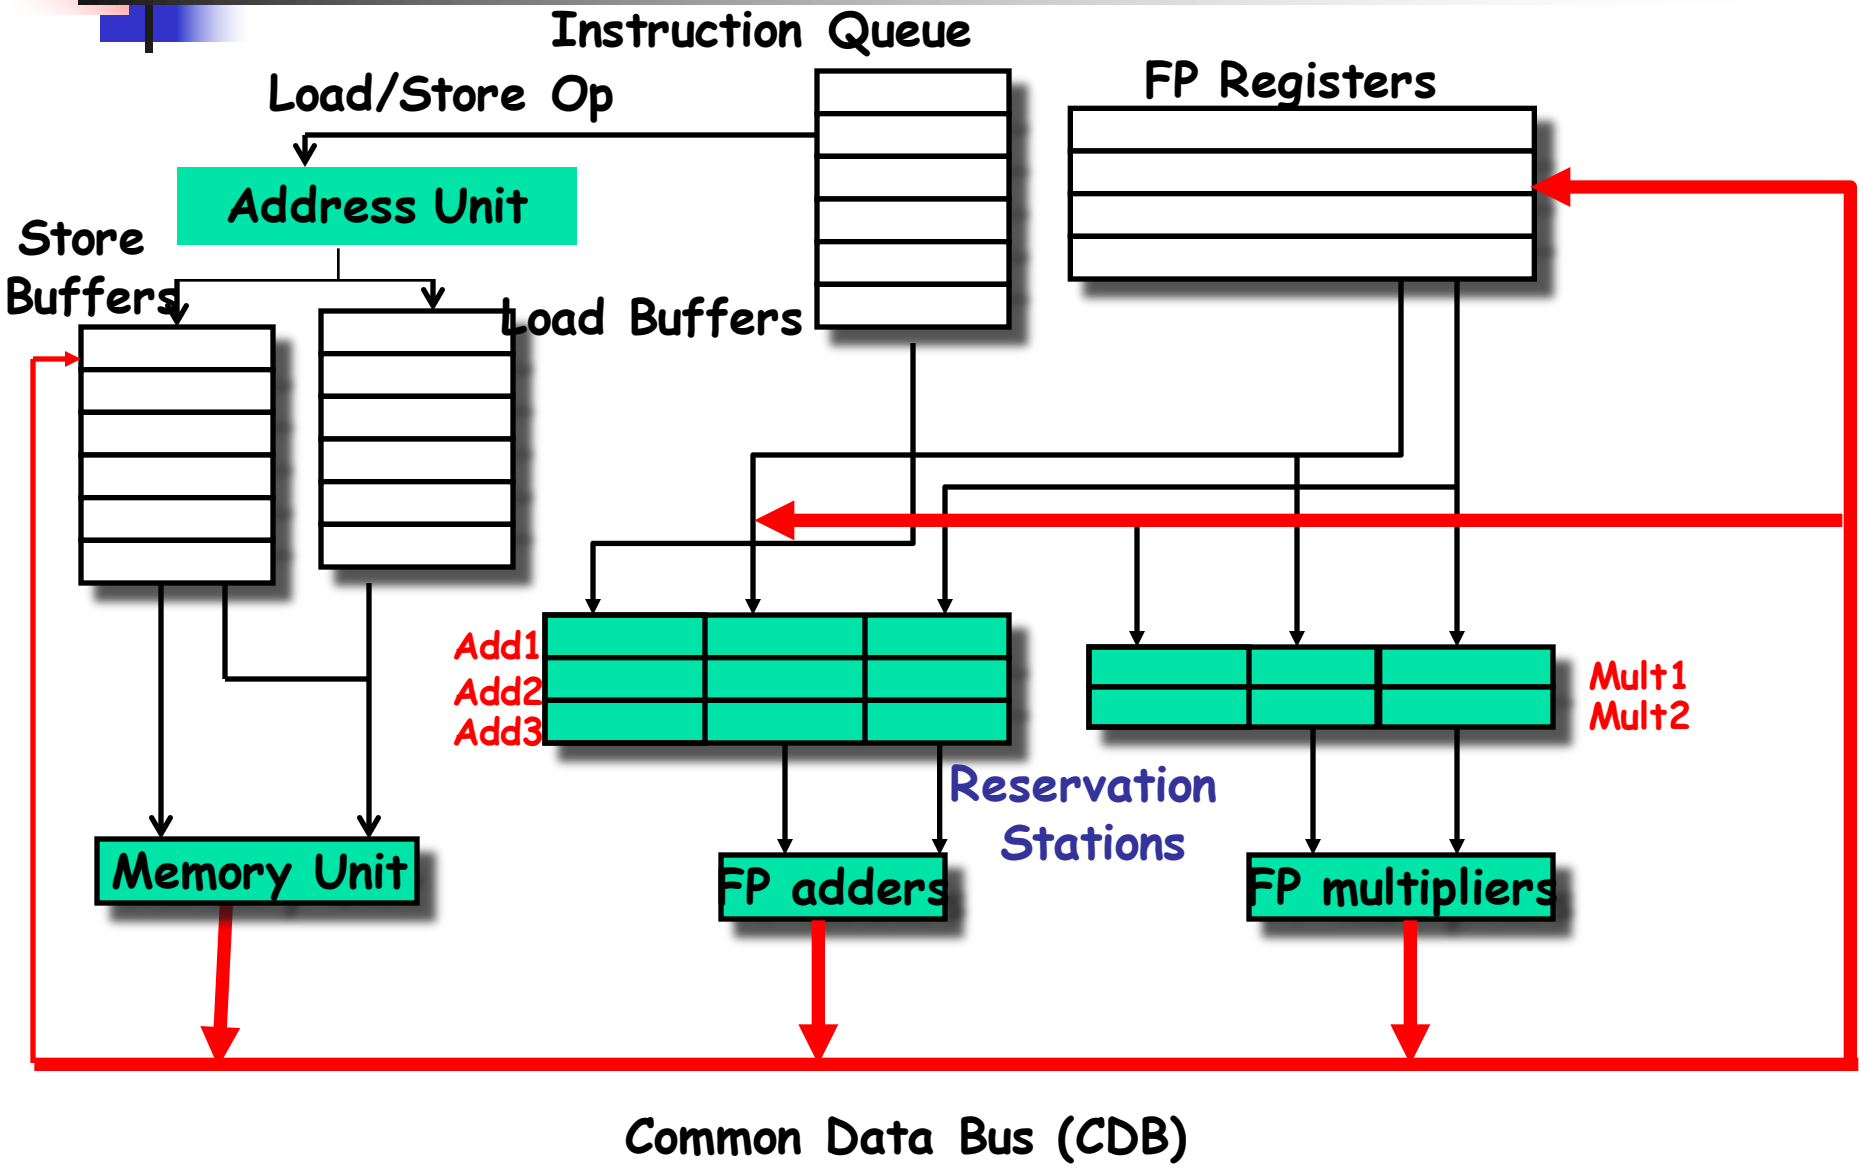
Jian-Jia Chen

(Slides are based on the lecture note from Prof. Chia-Lin Yang)

Dynamic Scheduling Mechanisms: Tomasulo Algorithm

- For IBM 360/91 about 3 years after CDC 6600
- Goal: High Performance without special compilers
- Small number of floating point registers (4 in 360) prevented interesting compiler scheduling of operations
  - This led Tomasulo to try to figure out how to get more effective registers — renaming in hardware!
- Why Study 1966 Computer?
- The descendants of this have flourished!
  - Alpha 21264, Pentium 4, AMD Opteron, Power 5, …

Tomasulo Organization



Reservation Station Components

Op operation to perform in the unit (e.g., + or -)

Qj, Qk reservation stations producing source registers

Vj, Vk value of source operands

Busy indicates reservation station and FU is busy

Register result status indicates which functional unit will write each register, if one exists. Blank when no pending instructions that will write that register.

Three Stages of Tomasulo Algorithm

1. Issue get instruction from FP Op Queue

   If reservation station free, issue instr & send operands to the reservation station. This steps also performs the process of renaming registers.

2. Execution operate on operands (EX)

   When both operands ready then execute;
   if not ready, watch CDB for result

3. Write result finish execution (WB)

   Write on Common Data Bus to all awaiting units;
   mark reservation station available.

Tomasulos Algorithmus: Beispiel

Instruction stream

Instruction status:

Instruction		*j*	*k*	*Issue*	*Exec Comp*	*Write Result*
LD	F6	34+	R2			
LD	F2	45+	R3			
MULTD	F0	F2	F4			
SUBD	F8	F6	F2			
DIVD	F10	F0	F6			
ADDD	F6	F8	F2			

	Busy	Address
Load1	No	
Load2	No	
Load3	No	

3 Load/Buffers

Reservation Stations:

Time	*Name*	*Busy*	*Op*	*S1 Vj*	*S2 Vk*	*RS Qj*	*RS Qk*
	Add1	No					
	Add2	No					
	Add3	No					
	Mult1	No					
	Mult2	No					

FU count down

3 FP Adder R.S.
2 FP Mult R.S.

Register result status:

Clock	*F0*	*F2*	*F4*	*F6*	*F8*	*F10*	*F12*	...	*F30*
0	*FU*								

Clock cycle counter

Tomasulos Algorithmus: Zyklus 1

Instruction status:

Instruction		*j*	*k*	*Issue*	*Exec Comp*	*Write Result*
LD	F6	34+	R2	1		
LD	F2	45+	R3			
MULTD	F0	F2	F4			
SUBD	F8	F6	F2			
DIVD	F10	F0	F6			
ADDD	F6	F8	F2			

	Busy	*Address*
Load1	Yes	34+R2
Load2	No	
Load3	No	

Reservation Stations:

Time	*Name*	*Busy*	*Op*	*S1 Vj*	*S2 Vk*	*RS Qj*	*RS Qk*
	Add1	No					
	Add2	No					
	Add3	No					
	Mult1	No					
	Mult2	No					

Register result status:

Clock		*F0*	*F2*	*F4*	*F6*	*F8*	*F10*	*F12*	...	*F30*
1	*FU*				Load1					

Tomasulos Algorithmus: Zyklus 2

Instruction status:

Instruction		j	k	Issue	Exec Comp	Write Result
LD	F6	34+	R2	1		
LD	F2	45+	R3	2		
MULTD	F0	F2	F4			
SUBD	F8	F6	F2			
DIVD	F10	F0	F6			
ADDD	F6	F8	F2			

	Busy	Address
Load1	Yes	34+R2
Load2	Yes	45+R3
Load3	No	

Reservation Stations:

Time	Name	Busy	Op	S1 Vj	S2 Vk	RS Qj	RS Qk
	Add1	No					
	Add2	No					
	Add3	No					
	Mult1	No					
	Mult2	No					

Register result status:

Clock		F0	F2	F4	F6	F8	F10	F12	...	F30
2	FU		Load2		Load1					

Hinweis: mehrere Ladebefehle können im Lade Puffer gelassen werden.

Tomasulos Beispiel: Zyklus 3

Instruction status:

Instruction		j	k	Issue	Exec Comp	Write Result
LD	F6	34+	R2	1	3	
LD	F2	45+	R3	2		
MULTD	F0	F2	F4	3		
SUBD	F8	F6	F2			
DIVD	F10	F0	F6			
ADDD	F6	F8	F2			

	Busy	Address
Load1	Yes	34+R2
Load2	Yes	45+R3
Load3	No	

Register renaming

Reservation Stations:

Time	Name	Busy	Op	S1 Vj	S2 Vk	RS Qj	RS Qk
	Add1	No					
	Add2	No					
	Add3	No					
	Mult1	Yes	MULTD		R(F4)	Load2	
	Mult2	No					

Register result status:

Clock		F0	F2	F4	F6	F8	F10	F12	...	F30
3	FU	Mult1	Load2		Load1					

- Hinweis : Das Register F2 wird umbenannt zu Load2 von der Reservation Station.
- Load1 wird im nächsten Zyklus fertig sein. Welcher Befehl braucht Load1?

Tomasulos Algorithmus: Zyklus 4

Instruction status:

Instruction		j	k	Issue	Exec Comp	Write Result
LD	F6	34+	R2	1	3	4
LD	F2	45+	R3	2	4	
MULTD	F0	F2	F4	3

- Noch einmal: In-order issue, out-of-order execution and out-of-order completion. (In-order Ausgabe, out-of-order Ausführung, und out-of-order Fertigstellung)

Tomasulos Algorithmus: Ausführung für Schleifen

```
Loop:   LD      F0    0     R1
        MULTD   F4    F0    F2
        SD      F4    0     R1
        SUBI    R1    R1    #8
        BNEZ    R1    Loop
```

- vereinfachte Annahme: MULTD dauert 4 Taktzyklen
- Annahme: Der erste LD Befehl dauert 8 Taktzyklen (L1 Cache Miss). Die folgenden LD Befehle dauern nur 1 Taktzyklus (L1 Cache Hit)
- Sprungvorhersage: immer ausgeführt
- Wir führen hier nur 2 Iterationen aus

Tomasulos Algorithmus: Schleife

Instruction status:

ITER	Instruction	j	k	Issue	Exec Comp	Write Result
1	LD F0	0	R1

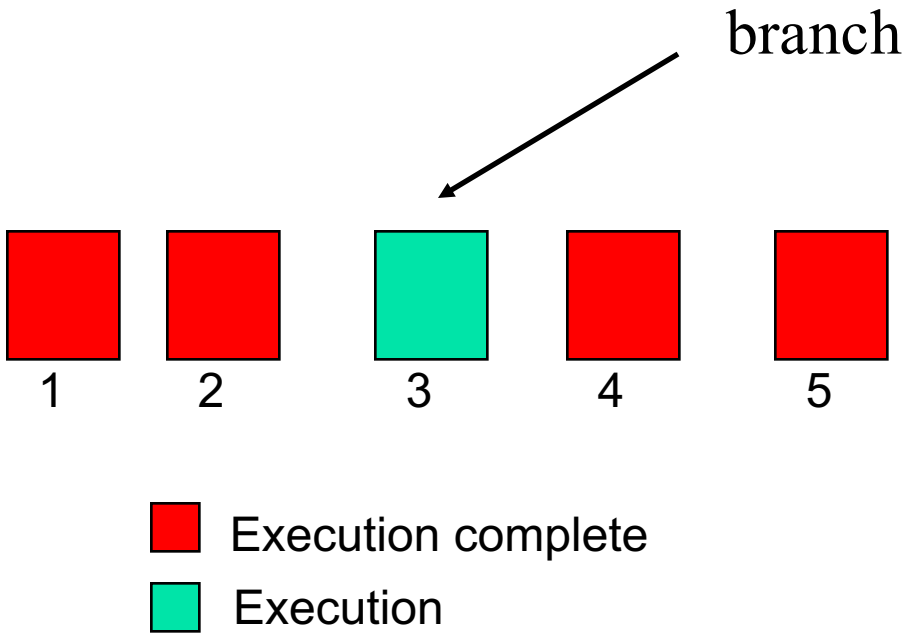
- Noch einmal: In-order issue, out-of-order execution and out-of-order completion. (In-order Ausgabe, out-of-order Ausführung, und out-of-order Fertigstellung)

Hardware Based Speculation (cont'd)

- Three key ideas
  - Dynamic branch prediction
    - Choose which instructions to execute
  - Speculative execution
    - Allow execution of instructions before the control dependences are resolved
    - HW undo if prediction is wrong
  - Dynamic instruction scheduling
    - Scheduling different combinations of basic blocks
    - Exploiting more ILP requires that we overcome the limitation of control dependence:

Hardware Speculation



- Instruction 1 & 2 are allowed to change the machine state
- Instruction 4 & 5 should not change the machine state

Hardware Speculation

- Tomasulo without speculation
  - Issue
  - Execution
  - Write Result
    - write results to the CDB & update the register file or memory
- Tomasulo with speculation
  - Issue
  - Execution
  - Write Result
    - write results to the CDB & store results in a HW buffer (Reorder Buffer)
  - Commit
    - Update register file or memory

Four Steps of Speculative Tomasulo Algorithm

1. Issue—get instruction from FP Op Queue

   If reservation station and reorder buffer slot free, issue instr & send operands & reorder buffer no. for destination.

2. Execution—operate on operands (EX)

   When both operands ready then execute; if not ready, watch CDB for result; when both in reservation station, execute

3. Write result—finish execution (WB)

   Write on Common Data Bus to all awaiting FUs & reorder buffer; mark reservation station available.

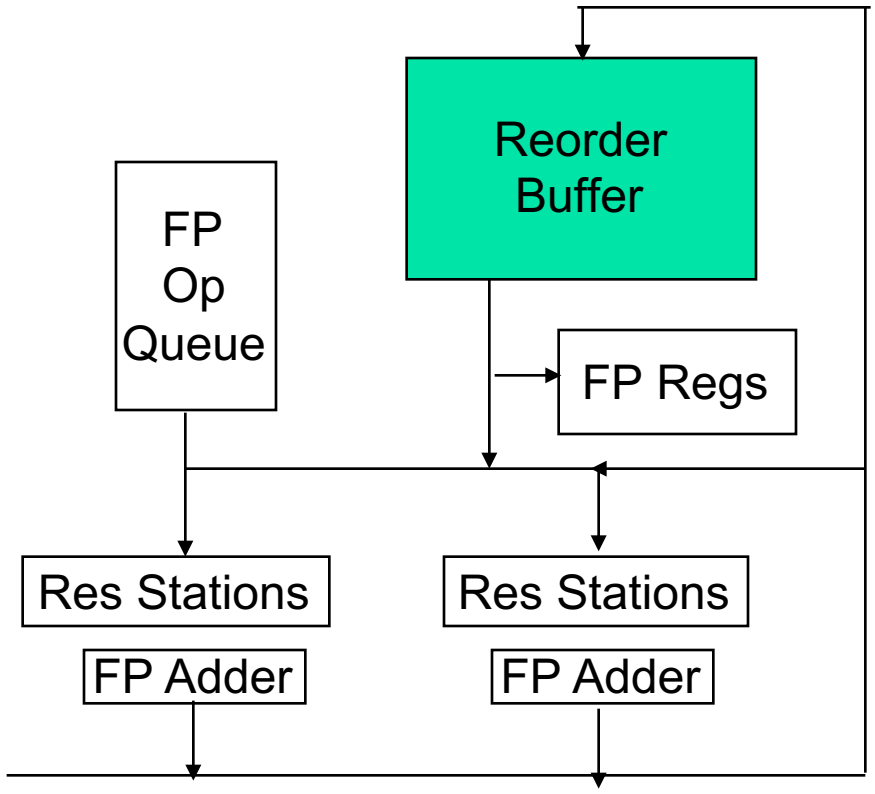
4. Commit—update register with reorder result

   When instr. at head of reorder buffer & result present, update register with result (or store to memory) and remove instr from reorder buffer.

Hardware Speculation

- Need HW buffer for results of uncommitted instructions: *reorder buffer*

```
:::
:::
MULTD   F0, F2, F4
DIVD    F10,F0,F6
::::
```



Reservation Station

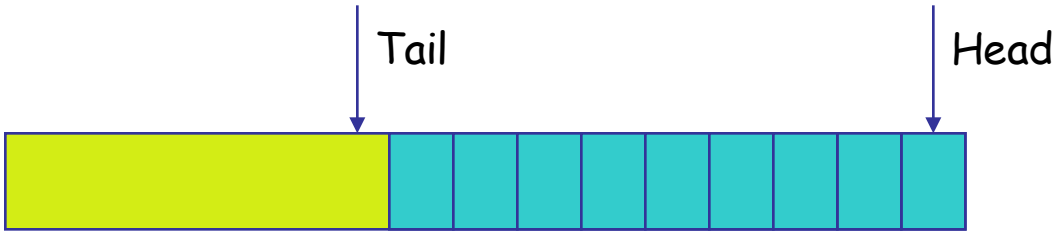
	Busy	Op	Vj	Vk	Qj	Qk	Dest
Mult1	Yes	mult	[F2]	[F4]			#1
Mult2	Yes	div		[F6]	#1		

Reorder Buffer

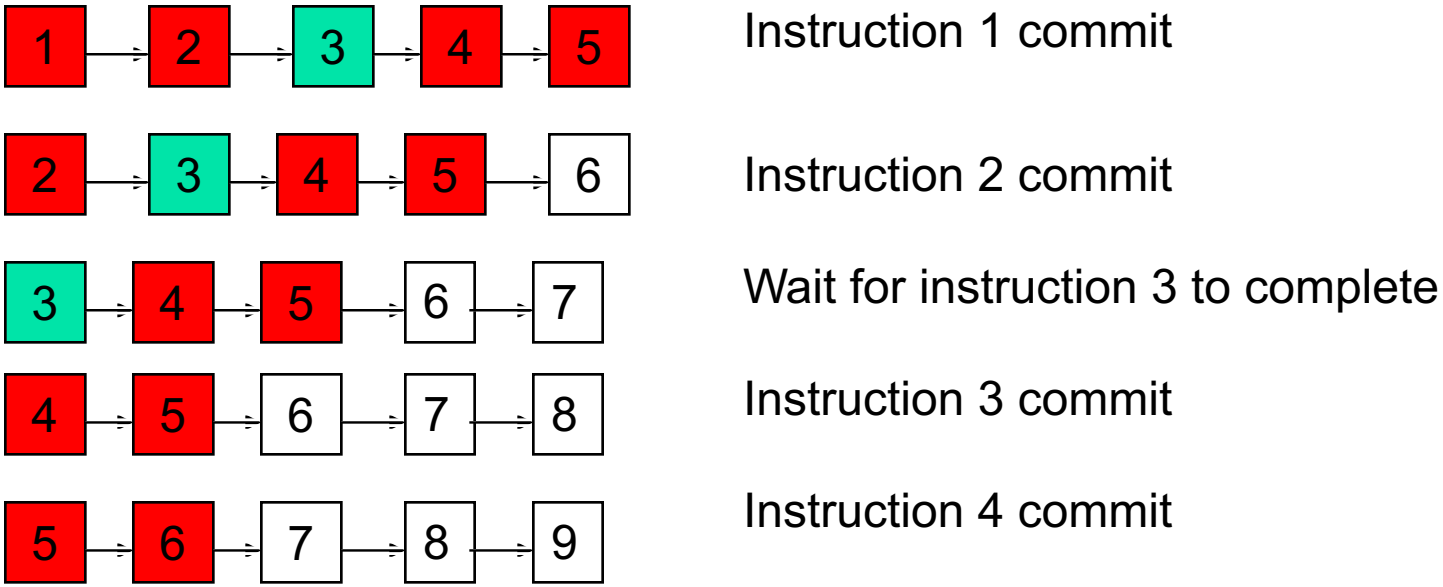
	Busy	Instruction	State	Destination	Value
#1	yes	multd f0,f2,f4	Write Result	F0	x
#2	yes	divd f10,f0,f6	Execute	F10	

Reorder Buffer

- **It is a simple circular array with a head and a tail pointer:**
  - **New instructions is allocated a position at the tail in program order.**
  - **Each entry provides a location for storing the instruction's result.**
  - **When the instruction at the head complete and becomes non-speculative the values are committed and the instruction is removed from the buffer.**

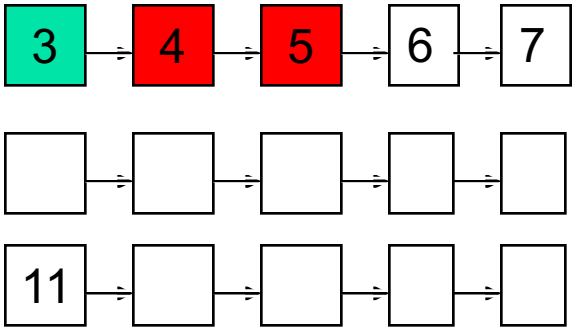


Commit Stage



Speculative Execution

- How to handle mispredicted branch?



Inst 3 is a mispredicted branch

flush the reorder buffer

Fetch from the right path

Avoiding Memory Hazards

- WAW and WAR hazards through memory are eliminated with speculation because actual updating of memory occurs in order, when a store is at head of the ROB, and hence, no earlier loads or stores can still be pending
- RAW hazards through memory are maintained by two restrictions:
  1. not allowing a load to initiate the second step of its execution if any active ROB entry occupied by a store has a Destination field that matches the value of the address field of the load, and
  2. maintaining the program order for the computation of an effective address of a load with respect to all earlier stores.
- these restrictions ensure that any load that accesses a memory location written to by an earlier store cannot perform the memory access until the store has written the data

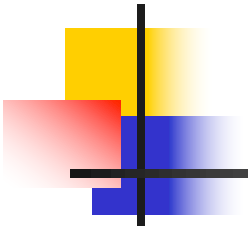
hardwarebasierte spekulative Ausführung

- *Speculation*: allow an instruction to execute that is dependent on a predicted branch *without* any consequences (including exceptions) if branch prediction is wrong ("HW undo")
- Speculative Execution vs.

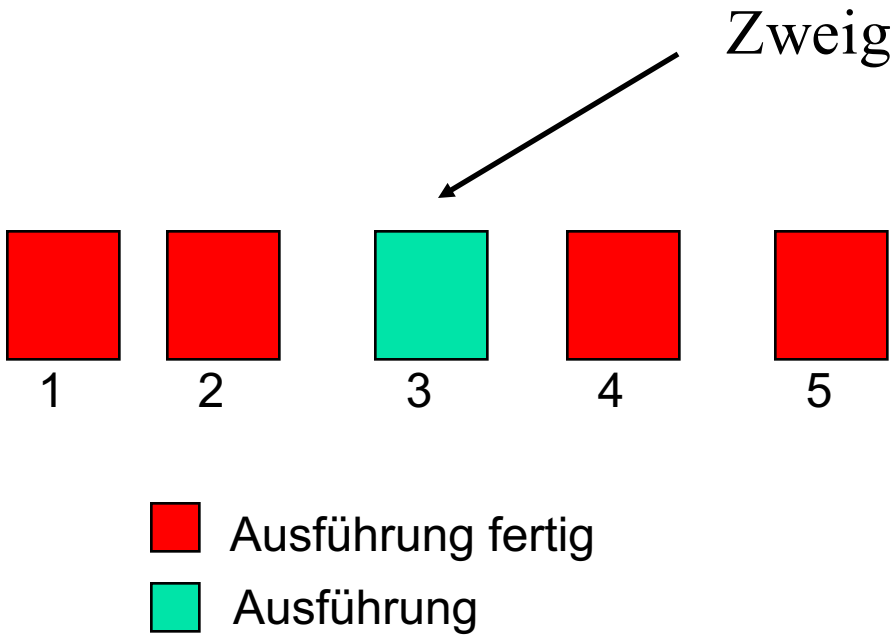
  Dynamic branch prediction + dynamic instruction scheduling
  - Speculative execution
    - Speculate the outcome of a branch and fetch, issue and execute instructions
  - Dynamic instruction scheduling + branch prediction
    - Speculate the outcome of a branch, and fetch, issue instructions



hardwarebasierte spekulative Ausführung

- Drei Ideen
  - dynamische Sprungvorhersagen (dynamic branch prediction)
    - wählen welche Befehle auszuführen aus
  - spekulative Ausführung (speculative execution)
    - erlauben Ausführungen der Befehle bevor die Kontrolflussabhängigkeit gelöst wird
    - löschen im HW wenn die Vorhersage unrichtig ist
  - dynamische Befehlsausführung (dynamic instruction scheduling)
    - führen verschiedene Kombinationen von Befehlen aus
    - bearbeiten die Limitierung von Kontrolflussabhängigkeit, um bessere ILP zu bekommen

hardwarebasierte spekulative Ausführung



- Befehle 1 & 2 werden den Maschinenzustand zu verändern erlaubt
- Befehle 4 & 5 sollen den Maschinenzustand nicht verändern

hardwarebasierte spekulative Ausführung

- Tomasulo ohne Spekulation
  - Issue
  - Execution
  - Write Result
    - write results to the CDB & update the register file or memory

- Tomasulo mit Spekulation
