

# Design Your Own CPU

Mikail Yayla

**Department of Computer Science, Chair 12  
TU Dortmund University, Germany**

April 13, 2021

# How can we design a processor?

---

## General principle: Step-by-step

- Design and test simple components
- Connect simple components to form more complex component, test again
- Hide complexity: Complex component becomes simple

# How can we design a processor?

---

## General principle: Step-by-step

- Design and test simple components
- Connect simple components to form more complex component, test again
- Hide complexity: Complex component becomes simple

## Sounds familiar?

- In RS, we saw a simple processor and how it works
- Implementing CPU completely on our own without any help would be difficult
- Take a simplified version of the MIPS processor as an example
- Learn the skills necessary to design and test a simple CPU
- Apply learned skills to design more sophisticated systems

# VHDL (VHSIC Hardware Description Language)

---

## What is it?

- A hardware description language
- Describe digital circuits for specification
- Simulate digital circuits for testing
- Can be synthesized and then run on real hardware

# VHDL (VHSIC Hardware Description Language)

---

## What is it?

- A hardware description language
- Describe digital circuits for specification
- Simulate digital circuits for testing
- Can be synthesized and then run on real hardware

## Learning VHDL has many benefits!

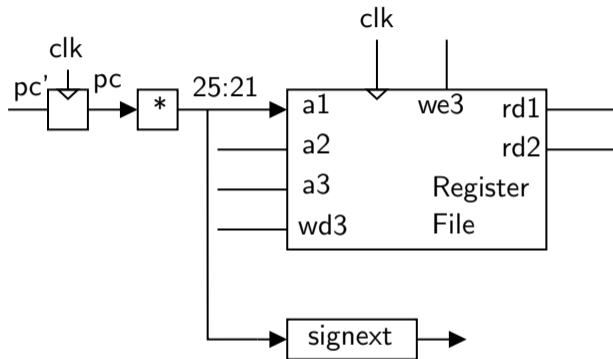

- Used widely in the industry by many leading companies
- Design digital systems from scratch
- Run designs in simulators and on real hardware
- Preparation for jobs on digital design

# How to build a CPU: State Elements

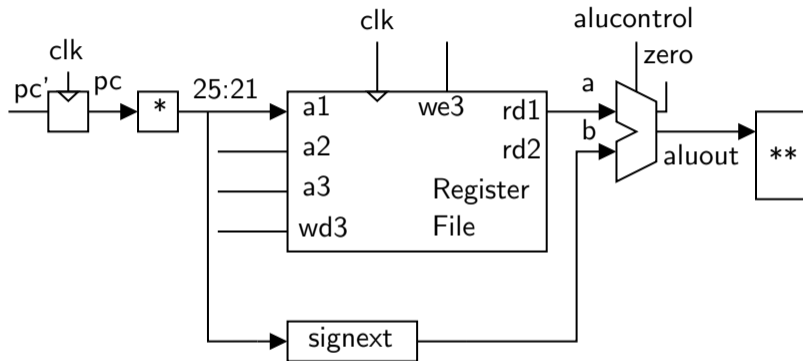

---

# How to build a CPU: Connect State Elements

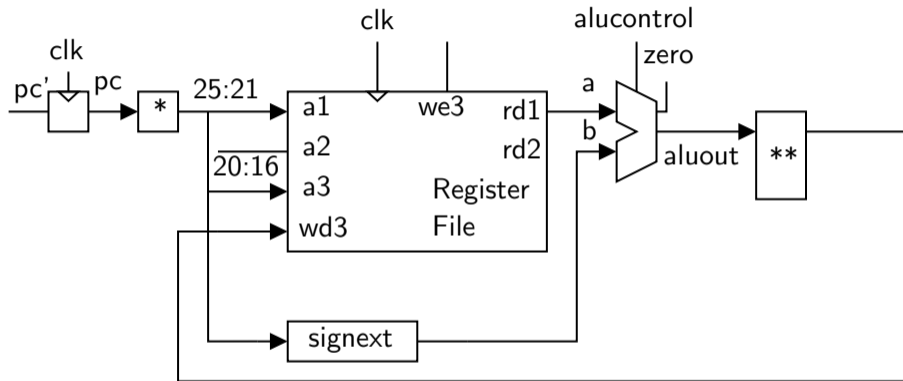

# How to build a CPU: Connect ALU

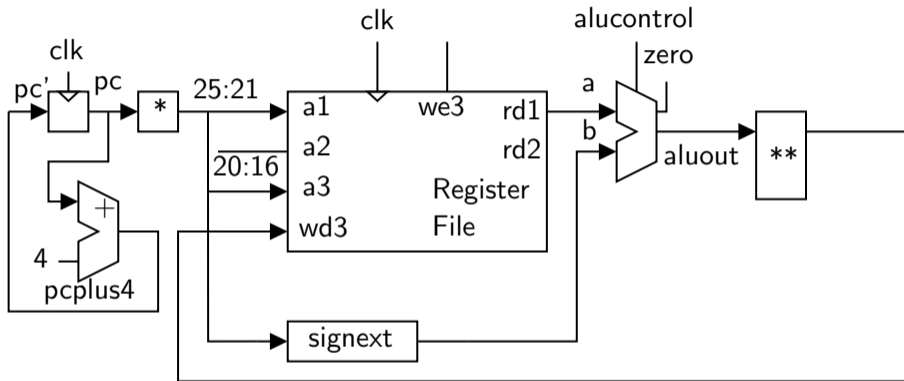

# How to build a CPU: Load Word

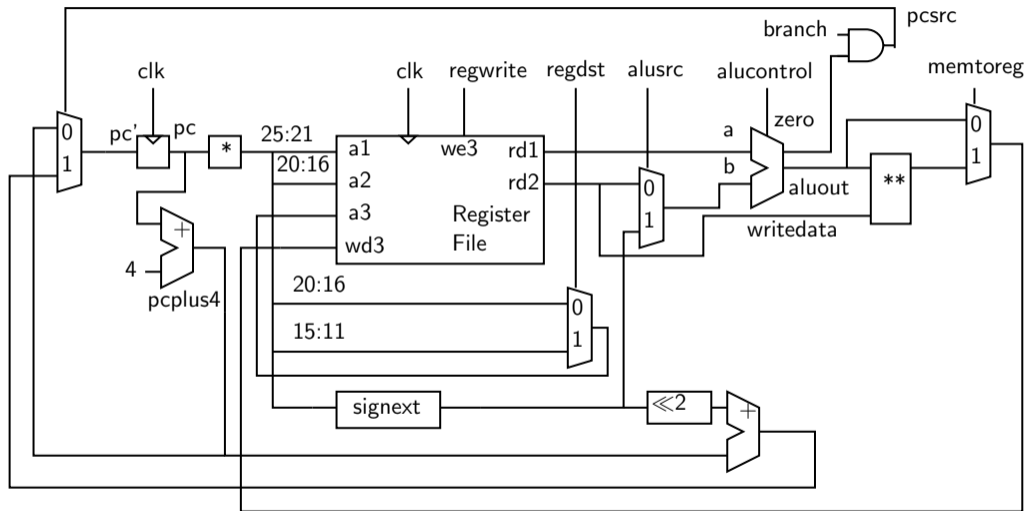

# How to build a CPU: PC+4

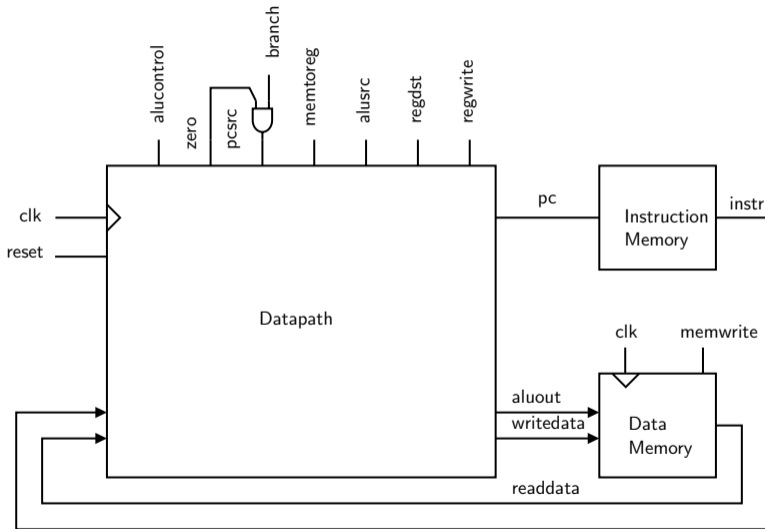

# How to build a CPU: Multiplexers for Control

# How to build a CPU: Hide Complexity

# Some Project Ideas

---

- Add support for more instructions
- Advance single cycle MIPS: Multicycle, pipelines, branch predictions, superscalar, SIMD, and many more possibilities!
- Build extensions (e.g. for matrix-mul., neural networks, other ML, etc.)
- Design another CPU from scratch (RISC-V, older CPUs like Intel 8080, GameBoy processor, etc.)
- Modify another existing CPU microarchitecture
- ...
- Start here, continue as a bachelor thesis!

## Timeplan

- Weeks 1-3: Crash course in VHDL and CPU Design
  - Basic concepts in VHDL
  - Tools: GHDL and GTKWave
  - Implementation of logic gates
  - Design process of MIPS CPU and testing
- Weeks 4-5: Seminar phase
  - Focus on topics that are interesting to you
  - Build your expertise
- From week 6 on: Finalize plans and work on project
  - Work in a group to realize your project idea
  - Focus on experience
  - You have time until the semester ends
